Income Payments to Individuals, by States, 1929-38

By John L. Martin, National Income Division

ER CAPITA income payments in the United States in 1938 amounted to 515 dollars, with a variation on a State basis from 205 dollars in Mississippi to 822 dollars in New York. Per capita income was above the national average in nineteen States and the District of Columbia, and below it in twenty-nine. Twenty-six States had per capita incomes of more than 400 dollars but less than 600 dollars.

Table 1.—Number of States 1 With Per Capita Income Payments at Different Levels, 1929-38

Not only does income in any year vary among States, but there is considerable variation in the year-to-year movements. From 1929 to 1933 per capita incomes fell substantially in all States, with declines of less than 40 percent in nine States and of more than 50 percent in seven States. During the period from 1933 through 1937, per capita income payments rose more than 70 percent in nine States and less than 40 percent in ten States, an improvement ranging from 28 percent in Massachusetts to 97 percent in Michigan. From 1937 to 1938 declines were again both universal and uneven.

Table 2.—Number of States Showing Indicated Percentage Changes in Per Capita Income Payments, Selected Periods, 1929–1938

1929-33		1933-37		1937–38

Income payments as classified in the State estimates are of four major types: Salaries and wages, other labor income (direct and work relief and unemployment benefits, workmen's compensation, pension payments, and related items), entrepreneurial withdrawals (the incomes of self-employed persons), and capital return (dividends, interest, and net rents and royalties). These concepts are identical to those used in the national figures on income payments.

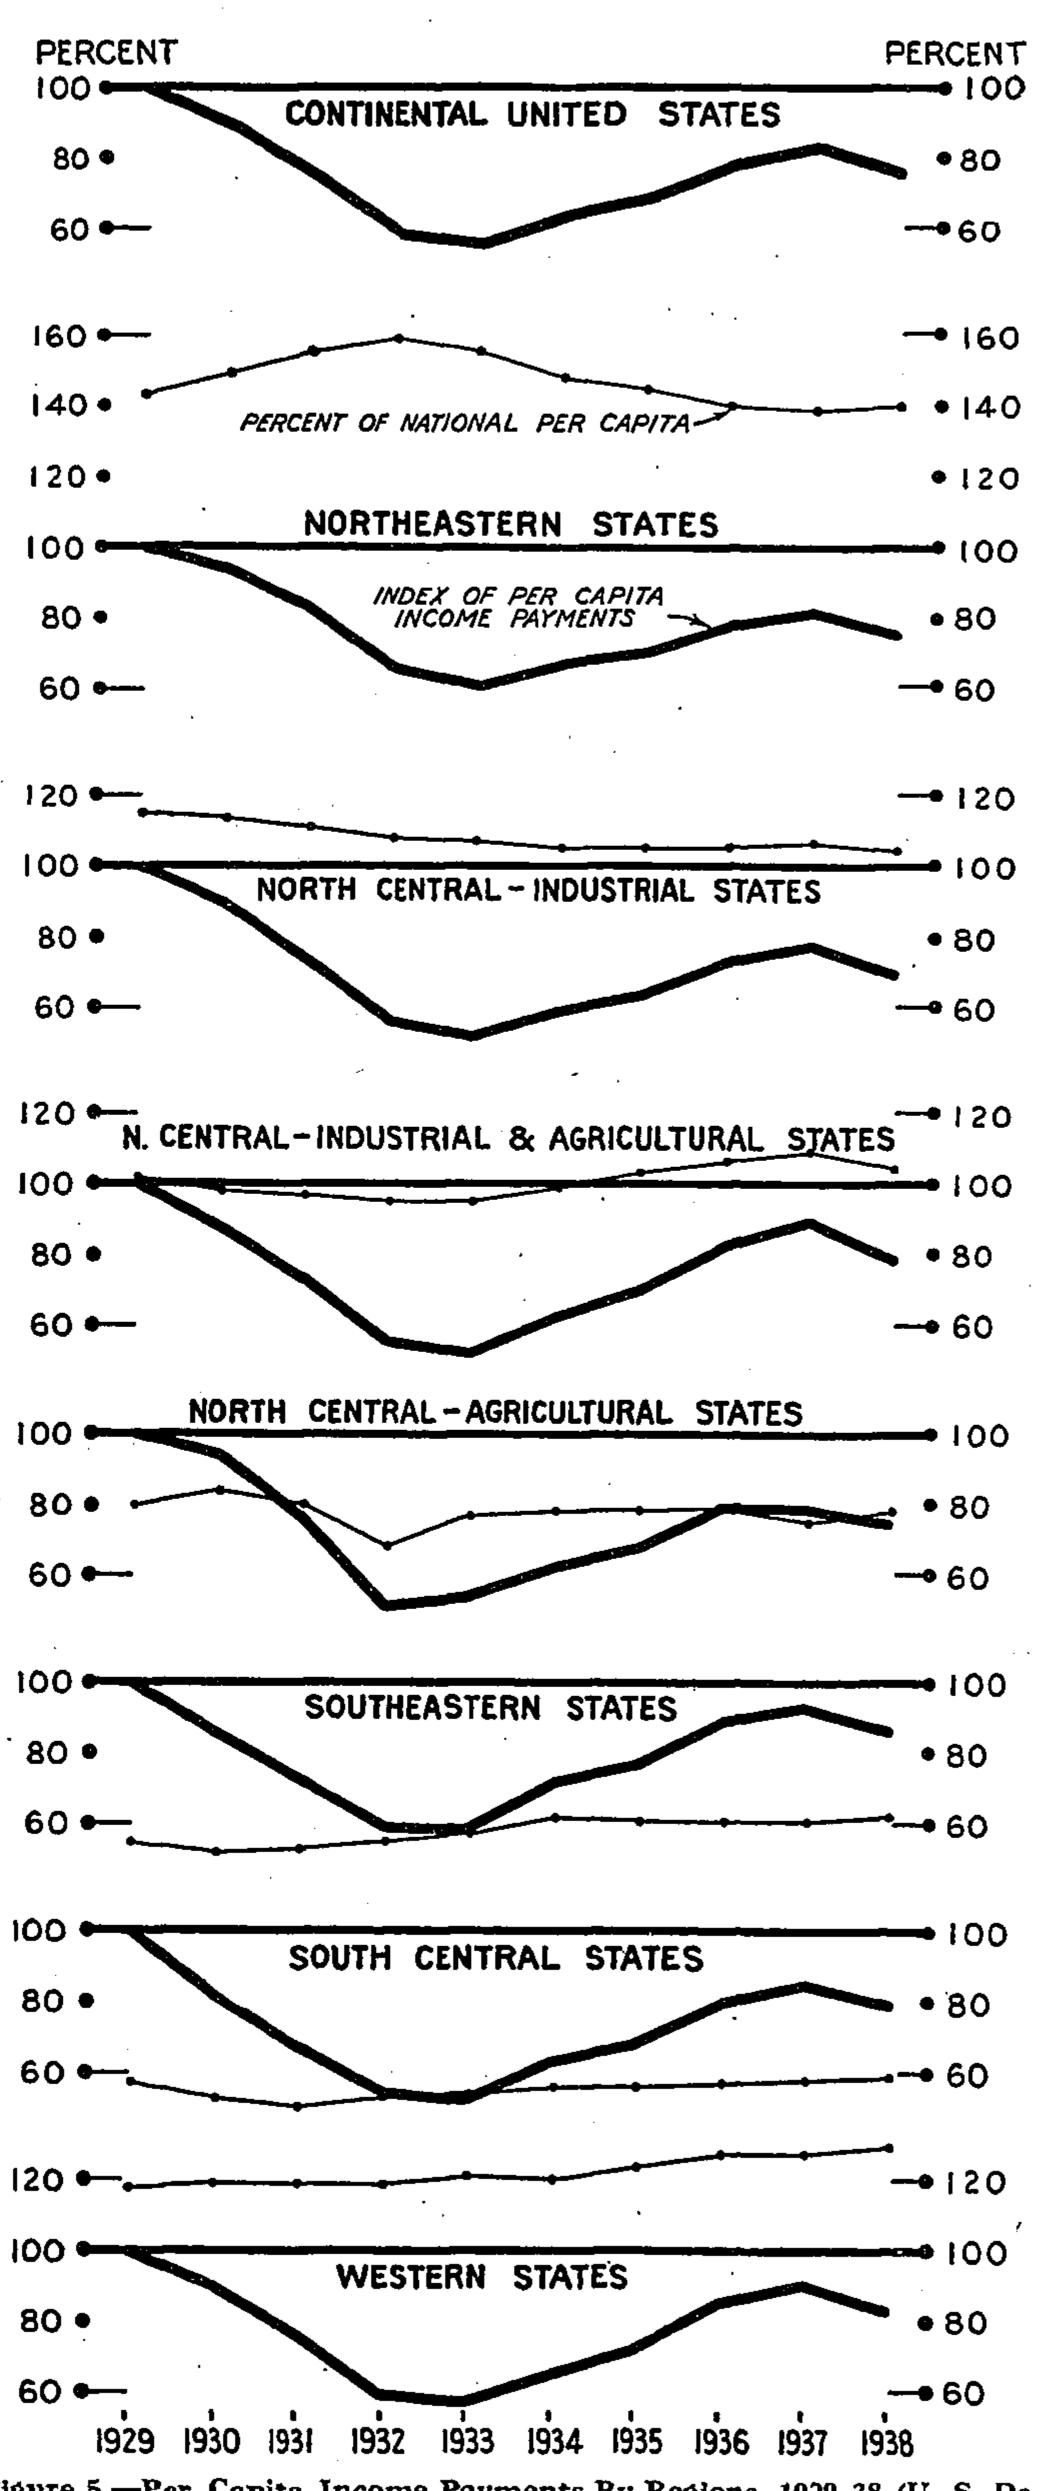

Table 3.—Number of States With Types of Income at Indicated Percentages of Total Payments, 1938

Percentage of total income payments	Salaries and wages	Other labor income	Entrepre- nurial with- drawals	Dividends, interest, and net rents and royalties

0 to 4.9 Percentages from national totals		7.2	17. 6	16. 1

Salaries and wages were the most important type of payment in every State in 1938 and accounted for nearly three-fifths of total income payments for the Nation. In 3 States more than 65 percent of total payments were received as salaries and wages, but residents of 7 States derived less than 50 percent of their income from this source. Other labor income provided more than 7 percent of total income payments for the country as a whole, and between 5 and 10 percent of total payments in 42 States. Entrepreneurial withdrawals accounted for a little more than one-sixth of total income payments for the Nation in 1938, while slightly less than one-sixth appeared in the form of capital return, with the relative importance of payments of these types varying widely among the States. Withdrawals, ranging from 8 percent in the District of Columbia to 40 percent in Mississippi, provided more than 25 percent of total payments in 16 States and less than 15 percent in 12 States. Capital return contributed more than one-fifth of total income payments in 6 States and less than one-tenth in 12 States.

The differences in averages, composition, and trends of income payments, as indicated in part in tables 1, 2, and 3, give significance to the data for individual States. Income payments reflect comprehensively the functioning of the economic organization in the different States and provide a background for better analyses of

other statistical and financial data relating more directly to the behavior of specific segments of the economy. An analysis of these differences is here presented only in broad outline. But to the businessman concerned with problems of sales control and marketing

1929 1930 1931 1932 1933 1934 1935 1936 1937 1938

development, and to Government units determining policy in social and fiscal matters, differences between the economies of particular areas as reflected in the pattern of income payments and variations in trends over a period of time are both significant factors, and the detailed figures given in tables 4 and 7 will permit more specialized analysis in approaching specific problems.

Per Capita Income Payments.

Although total income payments in particular States have definite significance, average or per capita incomes may be more useful measures for many analytical purposes. Income payments are primarily general measures of the ability of individuals to command goods and services, and the number of persons participating in a given quantitative demand is an important conditioning factor in determining the nature of the goods and services required.

Per capita income is derived by dividing an estimate of total income payments by an estimate of population. Both estimates are developed carefully and are based upon a wide variety of primary data, but source material is of such a nature that some margin of error must be recognized. Further, it is usually feasible only to assign salary and wage income to the State in which it is earned, and that is not always the State in which the recipient resides. Since there are areas where large cities located at or near State boundaries attract to employment the residents of bordering States, population data and income estimates are not strictly comparable. In such cases, per capita payments in the given State are too high and in the neighboring State too low. Computed per capita incomes for the District of Columbia are considerably inflated because of the high proportion of persons who work in Washington, D. C., but live in Virginia or Maryland, and average income in those States is computed at too low a level, although the bias in the State figures is less significant because of the larger area and population of the adjoining States.

The general cyclical swings of per capita income payments were similar in all States, but table 4 reveals that individual variations were often rather extreme. Per capita income in Massachusetts fell 30 percent from 1929 to 1932, less than the decline in any other State. In North Dakota, heavily influenced by poor years in agriculture, the drop was almost twice as severe, with average income per person in 1932 at only 41 percent of the 1929 figure. Recovery from 1933 to 1937 tended to be either modest or extreme as the preceding decline had been small or large. Per capita incomes in both New Jersey and Mississippi were both at about 80 percent of their respective 1929 averages in 1937, but stood at only 47 percent of the 1929 figure in Mississippi in 1933 in contrast with 59 percent in New Jersey.

¹ Data subject to limitations. See text.

Per capita incomes in Arizona, Florida, Idaho, Maryland, Minnesota, Montana, New Mexico, and North and South Carolina for 1937 were either above or approached the 1929 figure. The "real" income per person, i. e., dollar income adjusted for living costs, for these States in the later year was higher than in 1929. On the other hand, Alabama, Arkansas, Illinois, Missouri, Nebraska, North and South Dakota, and Oklahoma had returned by 1937 only to levels between 68 percent and 77 percent of their 1929 averages.

Composition and Sources.

The nature of income payments can be more readily understood by a closer examination of the four major types of payments mentioned above. Salaries and wages, including commissions, fees, and bonuses, are paid regularly by private and public employers of all types to individuals as a return for personal services currently rendered. As far as data permit, that portion of salary and wage items which flows into reserve

funds rather than directly to individuals (as, for instance, employee contributions under social security plans) is excluded from these estimates. Relatively minor amounts of payments in kind are included as salaries and wages in those industries where such payment is common—agriculture, water transportation, and domestic service.

There are also a number of other forms of income flowing primarily to labor but not related to services currently rendered, and these have been designated as "other labor income." This classification encompasses pension payments to individuals under independent plans sponsored by private employers, compensation payments to individuals on account of industrial injuries, adjusted service certificate disbursements, direct relief payments, benefits under social security programs, and similar items. Work relief wages are included in other labor income, because they cannot be separated from direct relief payments in the earlier years, but

most of the other items are related directly or indirectly to services rendered in the past.

The remaining two types of income payments are characterized by an element of return on invested capital. Entrepreneurial withdrawals are the sums taken by self-employed individuals who are owners and operators of unincorporated enterprises. These withdrawals include the earnings of the individual for his labor and management, as well as return on invested capital. The bulk of this item comes from farming and the practice of service professions, and in these fields withdrawals are held equivalent to net incomes; in other lines the greater importance of working capital requirements in the conduct of business tends to make withdrawals greater than net income in poorer years and less than net income in better years. Dividends, interest, and net rents and royalties are various forms of return on invested capital arising from equity and creditor participation and direct ownership. Rent and royalty returns are net after deduction for expenses of ownership, and interest items represent payments on long-term obligations only.

Basic data have been drawn from a large number of sources. Reports of the Bureau of the Census cover about half of the salary and wage items in 1 or more years, and pay-roll indexes prepared by the United States Bureau of Labor Statistics are used extensively for interpolation and extrapolation. Questionnaire surveys conducted by the National Income Division and data from the Bureau of Agricultural Economics, Office of Education, Bureau of Internal Revenue, Civil Service Commission, and many other public and private

organizations were utilized in making these estimates. In general, these State estimates are based upon national total figures developed over a period of years in the preparation of official estimates of national income.¹

Income payments differ from national income primarily by the inclusion only in national income of certain items which are not actual payments received by individuals and the inclusion only in payments of items which do not represent returns for labor or capital services currently rendered. Principal items of income payments not included in national income are direct relief, veterans' pensions and adjusted service benefits, and benefit payments under Social Security legislation. Items covered in national income but not in income payments include business savings (which were positive only in 1929) and contributions by both employees and employers under social security legislation.

Income Payments by Regions.

An examination of table 6 and figure 1 shows at once a relationship between urbanization and income level, and regional variations in income trends, averages, and composition. Analysis by regions is based upon homogeneity of a degree and is particularly dictated by space limitations in this article, but the general approach may be applied profitably in examining the characteristics and development of particular States either singly or in other groups. Groupings here employed are based upon general similarity rather than any single specific criterion. Variation within regions

¹ Northeastern States: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Delaware, Maryland, and District of Columbia. North central—industrial States: Pennsylvania. Illinois, Missouri. North central—industrial and agricultural States: Ohio, Indiana, Michigan, Wisconsin, Minnesota. North central—agricultural States: Iowa, North Dakota, South Dakota, Nebraska, Kansas. Southeastern States: Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida. South Central States: Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, Texas. Western States: Montana, Idaho, Wyoming, Colorado, New Mexico. Arizona, Utah, Nevada, Washington, Oregon, Celifornia.

² Per capita for District of Columbia is \$1,199. See text.

3 1932 ratio is 0.68.
 4 1936 ratio is 0.80.

is often significant and some indication of the extent thereof is given in the column specifying ranges of per capita incomes in 1938.

The Northeastern States are characterized by a high level of per capita income and high urbanization. Other labor income tends to be a lower percentage of total payments than in any other region, entrepreneurial withdrawals are relatively less important than elsewhere, and return on capital is a higher proportion of the total. Year-to-year changes in payments volume are less marked than for the Nation as a whole.

The pattern and behavior of income payments reflect the stage of economic development in the region. Such factors as specialization and the ownership of capital employed both within the region and elsewhere contribute heavily to high urbanization and high per capita income in the Northeastern States. Other labor income is a lower percentage of total payments because the region fared better in the poorer years of the period, and the low proportion of total payments appearing in the form of entrepreneurial withdrawals measures principally the fact that the farmer is a less important producer in the economy of this region.

The North Central industrial States 2 exhibit average income levels and moderately high urbanization. Salaries and wages and other labor income are more important as sources of income payments and entrepreneurial withdrawals are less important than the proportion for the Nation. There is a definite tendency for this area to claim a declining proportion of total income payments for the country as a whole, but this declining proportion may be primarily a reflection of more rapid development in other regions.

Income levels and urbanization for the North Central industrial and agricultural States are of about the same magnitude as in the more industrialized States in this portion of the country, and salary and wage payments and other labor income are here also more important than for all States combined, but capital return items are below the national level. The position of the region relative to all other regions seems to be improving gradually, since per capita income moved from 102 percent of the national average in 1929 to 109 percent in 1937. The so-called heavy industries are more important here than in the Northeastern States, and agriculture plays a greater part in the economy of this region. These two factors combine to produce the greater fluctuations noted for this area in table 6 in comparison with variations in the Northeastern States.

Urbanization in the North Central agricultural States is low, and per capita income is well under the average. Entrepreneurial withdrawals are of nearly twice their average importance because of the dominance of agriculture. Salaries and wages and capital return are lower relative to total payments than in any of the other areas. Cyclical changes were more violent than those displayed in the national pattern and timing was somewhat different; per capita income was cut in half between 1929 and 1932, improved between 1933 and 1936, and declined in the last 2 years of the period. The record of the region is largely the record of agriculture, and it was heavily influenced by the wide fluctuations in the prices of agricultural commodities, drought conditions, and Government crop-control programs which characterized all or part of the 10-year period.

Per capita incomes in the Southeastern and South Central States were the lowest of all the regions. Total income payments in both areas had a relatively low capital return content, and high proportions of entrepreneurial withdrawals reflect again the importance of the farmer. Both areas exhibited some tendency to improve relative to the national levels. This trend is particularly

² The line of demarcation between this group and those identified as the North Central industrial and agricultural States is less marked than the recognizable differences between other regions, but income patterns in Ohio and Michigan, for instance, are sufficiently different from those in Missouri to validate the grouping here employed. Note in table 4 that the ratio of per capita income in the States to the national figure is higher in 1937 in every State in the "industrial and agricultural" group than the figures expressing this relationship for 1929 where it is lower for each State in the "industrial" group.

apparent in the Southeastern States, where per capita payments moved from 55 percent of the average for all regions in 1929 to 61 percent in 1937 and 62 percent in 1938. Both regions are in a period of industrial development which will undoubtedly push per capita incomes to higher levels in the future.

In the Western States, per capita income tends to be high, although urbanization is below average except in California. Income composition follows the national pattern rather closely. This region also appears to be improving relative to the country as a whole; per capita income was only 18 percent above the national level in 1929 but advanced to 29 percent above the average for all regions in 1938.

This brief review indicates but a few of the major points of difference between regions, and incorporates only the concept of urbanization from among all of the important factors related to the levels, composition, and trends of income payments. Such population characteristics as age and racial distributions are also important.

Of the total population of the State of New York in 1930, 61 percent were between 20 and 64 years of age, whereas the comparable figure for South Carolina was only 46 percent. These may be presumed to be the years of greatest income-earning capacity and some

of the difference between the per capita incomes in the two States undoubtedly reflects the difference in age distributions of the inhabitants. Similarly, native white population in Indiana was 92 percent of total population in 1930, and the difference between average income in that State and per capita income in Alabama, for example, where the comparable figure was 64 percent, may trace in some measure to differences in racial composition. Such qualitative factors are important in any analysis of differences in levels, trends, and composition of income payments.

One further consideration is important where these data are to be used for marketing control or similar studies of primarily a fiscal nature: the relative market for luxury items is probably not measured directly by the relationship of total income payments in two different States. Necessities tend to have a prior claim against income payments, and luxuries would be purchasable only after requirements for necessities have been met, so that a greater proportion of total income payments would probably be used in the purchase of luxury goods by residents of States with higher per capita incomes. Determination of what might be termed the relative necessity—luxury characteristics of a particular item will control the per capita amount of income to which there are prior or more important claims.
